

CE conformity and the German Ordinance on Industrial Safety and Health (BetrSichV)

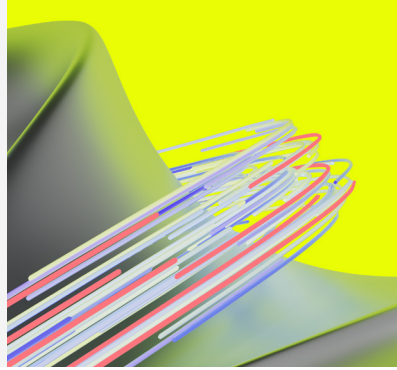

Technically and legally safe procurement and operation of plants and equipment

Hardly any other area of law is as subject to change as the EU Directives that apply throughout Europe to the manufacture and placing on the market of technical systems and system components on the European market. Within the scope of the procurement and operation of plants and system components, plant operators are exposed to constantly changing requirements affecting both legality and safety. The Ordinance on Industrial Safety and Health (BetrSichV) in force in Germany also requires further measures to be taken with regard to the operation, maintenance and testing of these plants.

Therefore, knowledge of the legal framework and fulfillment of the legal and safety requirements which result from the relevant EU Directives and operating regulations plays a central role in both procurement and operation. You can benefit from our extensive network and the extensive experience in procurement and plant operation gained from a large number of our own and external projects for the generation of electricity and heat, and in power-to-X and decarbonization projects.

Choose the support you need for your projects and plant operation.

We provide engineering services worldwide for the planning, construction, operation and optimization of power plants, and have been ensuring optimum solutions from a single source for the various power generation facilities for over 30 years.

Our qualified project implementation and quality assurance experts have in-depth knowledge of the relevant national, European and international directives and regulations (e.g. product safety, quality assurance, DIN EN, ISO, ASME, etc.) and extensive project experience to ensure conformity as a precondition for official approval of your newly designed plants. In the context of the implementation of your project, we can also provide comprehensive advice and support to your operating and maintenance personnel to ensure compliance with the legal requirements for commissioning, operational organization, plant operation, periodic testing, and maintenance work.

Our services include:

- Consulting and training regarding EU Directives, CE conformity and implementation of product safety law in accordance with the applicable standards
- Consulting and training regarding occupational health and safety
- Consulting and support in risk assessments for technical equipment and systems
- Advice on conducting risk assessments or analyzing hazards and risks
- Planning and monitoring of periodic testing and inspections
- Support in the condition assessment of plants requiring monitoring
- Assistance and advice during damage investigations
- Technical expertise from the operator's point of view (e.g. in the event of insurance claims)

We are happy to offer you our services in detail as a single solution or as a package.
